Research, 320 Charles Street, Cambridge, MA 02141, USA On Dec 20, 2002 this sequence version replaced gi:20128494. All repeats were identified using RepeatMasker: Smit, A.F. & Green, P. (1996-1997) http://ftp.genome.washington.edu/RM/RepeatMasker.html
                                                                                                                                                                                                                                                                                                                                                                               * NOTE: This record contains 88 individual

* sequencing reads that have not been assembled into

* contigs. Runs of N are used to separate the reads

* and the order in which they appear is Completely

* arbitrary. Low pass sequence sampling is useful for

* identifying clones that may be gene-rich and allows

* overlap relationships among clones to be deduced.

* However, it should not be assumed that this clone

* will be sequenced to completion. In the event that

* the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of 1141 bp in length

Submitted (15-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA, ON NOV 15, 2002 this sequence version replaced gi:23334632. The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contrig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tuc.edu/docs/Genbank draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 2 conigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

Submitted (19-MAY-2003) Human Genome Sequencing Center, Department of Modecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On May 9, 2003 this sequence version replaced gi:23270097.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using ARLas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold') within each contig-scaffold, biddidal sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank draft_data.html). NOTE: This is a "working draft' sequence. It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                    Submitted (27-AUG-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 161257: contig of 161257 bp in length 8 161357: gap of unknown length 8 188568: contig of 27213 bp in length 9 188668: gap of unknown length 9 246404: contig of 57736 bp in length. Submitted (20-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
On Nov 20, 2002 this sequence version replaced gi:24158508.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft' sequence It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 248554: contig of 248554 bp in length 1555 248554: gap of unknown length 1655 267822: contig of 19175 bp in length 1630 267929: gap of unknown length 1930 269946: contig of 1017 bp in length 1947 269046: gap of unknown length 1047 270958: contig of 1912 bp in length 16 Location/Qualifiers

The present sequence encodes for murine trinucleotide repeat protein

(TRP). The invention describes methods of producing embryonic stem (ES)

cells comprising a heteroxygous disruption in a target DNA sequence

(preferably gene T243) encoding a TRP and of producing a knockout mouse

comprising a homozygous disruption in a gene encoding TRP, where the

comprising a homozygous disruption in a gene encoding TRP, where the

comprision of inhibits the production of the wild type TRP. The invention

also relates to identifying agents capable of affecting a phenotype of a

knockout mouse. Also described are methods of determining whether

comprision of the trinucleotide repeat in a gene encoding TRP produces a

phenotypic change. The transgenic animals and the cells are useful for

identifying compounds capable of ameliorating disease symptoms, and as

comprision of the trinucleotide repeat of section in treating

therapies and interventions which may be effective in treating

conclusions. The animal models for trinucleotide repeat disorders encourance

conclusions to study the progression of disease in vivo, the molecular

model systems to study the progression of disease in vivo, the molecular

conclusions which man and show the features observed in human disease.

Consease The animal models for trinucleotide repeat disorders are ideal

model systems to study the progression of disease in vivo, the molecular

conclusions which man and the features observed in human disease. ig the mice, it is possible to model both the p trinucleotide repeat instability in the mouse the

The present sequence represents the DNA sequence of an expanded T243

gene. The T243 gene encodes for a trinucleotide repeat protein (TRP). The
invention describes methods of producing embryonic stem (ES) cells

comprising a heterozygous disruption in a target DNA sequence (preferably
gene T243) encoding a TRP and of producing a knockout mouse comprising a
homozygous disruption in a gene encoding TRP, where the disruption
inhibits the production of the wild type TRP. The invention also relates
to identifying agents capable of affecting a phenotype of a knockout
mouse. Also described are methods of determining whether expansion of the
trinucleotide repeat in a gene encoding TRP produces a phenotypic canage.
The transgenic animals and the cells are useful for identifying compounds
capable of ameliorating disease symptoms, and as test substrates for the
identification of drugs, pharmaceuticals, therapies and interventions
which may be effective in treating trinucleotide repeat disorders e.g.
fragile X syndrome and Huntington's disease. The animal models for
trinucleotide repeat disorders are ideal model system to study the
progression of disease in vivo, the molecular basis of these diseases and
show the features observed in human disease. Using the mice, it is
possible to model both the patchogenic mechanism and the trinucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel transgenic animals useful as animal model for characterization of function of a gene encoding trinucleotide repeat proteins (TRPs), contains heterozygous disruption in a gene encoding TRP.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        745
Novel gene encoding protein involved in fibroblast growth factor signal transduction, useful for analyzing mechanism of formation of organs such as midbrain optic-tectum portion, cerebellum, inner ear and canceration mechanism of cell.
                                                                                                                                                      The present sequence encodes a protein involved in fibroblast growth factor (FGF) signal transduction. Such proteins are useful for analyzing the mechanism of formation of various organs, such as midbrain optictectum portion by a midbrain mesencephalon border, the mechanism of formation of cerebellum. mechanisms of formation of inner ear, blood vessils limb buds reeth, and canceration mechanisms of a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       68

The present sequence representing the DNA sequence of a deleted gene fragment of the target T243 gene is generated by using a construct comprising T243 homologous sequences (AASO5284-AASO5285). The T243 gene encodes for a trinucleotide repeat protein (TRP). The invention describes methods of producing embryonic stem (ES) cells comprising a hererozygous disruption in a target DNA sequence (preferably gene T243) encoding a TRP can of producing a knockout mouse comprising a homozygous disruption in a gene croading TRP. Where the disruption inhibits the production of the wild type TRP. The invention also relates to identifying agents capable of affecting a phenotype of a knockout mouse. Also described are methods of determining whether expansion of the trinucleotide repeat in a gene cacding TRP produces a phenotypic change. The transgenic animals and the cells are useful for identifying compounds capable of ameliorating calsease symptoms, and as test substrates for the identification of drugs, tharmaceuticals, therapies and interventions which may be effective in treating trinucleotide repeat disorders e.g. fragile X syndrome and the trinucleotide repeat disorders e.g. fragile X syndrome and disorders are ideal model systems to study the progression of disease in civivo, the molecular basis of these diseases and show the features content mouse and the trinucleotide repeat instability in the mouse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gene potential; multi-lineage; cell commitment; haematopoietic stem cell; HSC; multipotent progenitor; MPP; common lymphoid progenitor; CLP; common myeloid progenitor; CMP; bone marrow stem cell; mouse; murine; ds.

This invention relates to a novel method for predicting gene potential by associating nucleic acid sequences of unknown function with particular by associating nucleic acid sequences of unknown function with particular cunknown multi-lineage affiliated gene by collecting hybridisation data to develop a gene expression map, in order to determine the discrete subcopulation where it is expressed. The present invention describes methods for predicting the lineage commitment of genes associated with the self-renewing haematopoietic (blood) stem cells (HSCs), as well as the nonself renewing multipotent progenitors (CMPs), common lymphoid progenitors (CLPs) and common myeloid progenitors (CMPs), which are collectively referred to as bone marrow stem cells populations. As such, these methods can be used to identify associated multi-lineage affiliated genes and hence the underlying molecular mechanisms in physiological haematopoietic development. This polynucleotide sequence is DNA associated with a murine HSC sub population of cells of the invention.
                                                                                                                                                                                      Classifying an unknown multi-lineage affiliated gene comprises isolating expressed nucleic acid sequences from the discrete cell sub-populations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    454 CACAACCTAGTCCACAAAGGGGTCAAGGTGGTGATGGATATCCCCTATGAGCTGTGGAAC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel method for predicting gene potential by subsociating nucleic acid sequences of unknown function with particular sub-population profiles. Specifically, it refers to classifying an unknown multi-lineage affiliated gene by collecting hybridisation data to develop a gene expression map, in order to determine the discrete sub-population where it is expressed. The present invention describes methods for predicting the lineage commitment of genes associated with the self-renewing haematopoietic (blood) stem cells (HSCs), as well as the nonself renewing multipotent progenitors (CMPs), which are collectively referred to as bone marrow stem cells populations. As such, these methods can be used to identify associated multi-lineage affiliated genes and hence the underlying molecular mechanisms in physiological haematopoietic development. This polynucleotide sequence is DNA associated with a murine

                                                                                The present sequence for T243 homologous sequence #1 is generated by PCR and is homologous to the T243 gene which encodes for a trinucleotide corpeat protein (TRP). The invention describes methods of producing embryonic stem (ES) cells comprising a heteroxygous disruption in a crayet DNA sequence (preferably gene T243) encoding TRP and of producing a knockout mouse comprising a homozygous disruption in a gene cancoding TRP, where the disruption inhibits the production of the wild type TRP. The invention also relates to identifying agents capable of affecting a phenotype of a knockout mouse. Also described are methods of determining whether expansion of the trinucleotide repeat in a gene encoding TRP produces a phenotype change. The transgenic animals and the cancoding TRP produces a phenotype change. The transgenic animals and the caclls are useful for identifying compounds capable of ameliorating disease symptoms, and as test substrates for the identification of drugs, pharmaceuticals, therapies and interventions which may be effective in treating trinucleotide repeat disorders e.g. fragile X syndrome and Huntington's disease. The animal models for trinucleotide repeat cdisorders are ideal model systems to study the progression of disease in vivo, the molecular basis of these diseases and show the features conserved in human disease. Using the mice, it is possible to model both mouse
                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9 GGAGGAAGCGCCGCCGCGCTCTCTCTGGGTCCGGCTGGGCCATGGAGTCCATGTC 68
          Novel transgenic animals useful as animal model for characterization of function of a gene encoding trinucleotide repeat proteins (TRPs), contains heterozygous disruption in a gene encoding TRP.

```
stranded DNA) which comprises one of the 7837 "GS" sequences given in AAT19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is clamed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular fissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell
                                                                                                                                                                                                                         double
Single-stranded DNA for identifying gene signatures - isolated from 3'-directed human cDNA library that reflects relative abundance of corresp.mRNA in specific human tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A method, useful for prognosing and treating solid tumor, comprises comparing an expression profile of a gene expressed in peripheral blood mononuclear cells to a reference expression profile of a gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention describes a method comprising comparing an expression

unaupervised clustering analysis of gene expression profiles in PBMCs of a population of patients who have the solid tumour, and where the adjustive class of patients has a first clinical outcome, and che first class of patients has a first clinical outcome, and the majority of the second class of patients has a first clinical outcome, and the majority of the second class of patients has a second clinical outcome, and cutcome. Also described are: a system comprising (i) a memory or a coutcome in a peripheral blood sample of a patient who has a solid tumour, (ii) at least one reference expression profile of the gene, (iii) a program capable of comparing the expression profile of the gene, (iii) a program, where expression levels of the gene, (iii) a program, where expression levels of the gene in peripheral blood monounclear cells of patients who have the solid tumour correlate with clinical outcomes of the patients and a nucleic acid or protein array componitiang concentrated probes for solid tumour prognosis genes is differentially expressed in PBMCs of a first class of patients as compared to PBMCs of a second class of patients as compared to PBMCs of a second class of patients as compared to PBMCs of a second class of patients has a second class of patients as colid tumour prognosis gene colid tumour prognosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
profile of at least one gene in a peripheral blood sample of a patient to at least one reference expression profile of the at least one gene, where the patient has a solid tumour, and each of the gene is differentially expressed in peripheral blood mononuclear cells (PBMCs) of a first class of patients as compared to PBMCs of a second class of patients, where both the first and second classes of patients have the solid tumour, and each of the first and second classes is a subcluster formed by an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunogenic protein; cancer; ovarian tumour; T-cell stimulation; 88; gene therapy; cytostatic; T-cell expansion; nucleic acid hybridisation;

                                                                                                                                              The invention comprises compositions used for the therapy and diagnosis of ovarian cancer. The compositions comprise one or more ovarian tumour proteins, their associated polymucleotides, or immunogenic portions of the proteins. The ovarian tumour polymucleotides and polypeptides are useful for stimulating and/or expanding T cells specific for a tumour protein. They are also useful for inhibiting the development of cancer in a patient with an ovarian tumour DNA or protein by incubating isolated T-cells allowing them to proliferate, and administering to the patient. The sequences can be used as markers for cancer, for example, to monitor ovarian cancer progression. Probes and primers are useful in nucleic acid hybridisation, in detecting the presence of complementary sequences in a given sample, for preparing mutant species and for preparing other genetic constructions. Sequences AAS23820-AAS25231 and AAS25328-AAS25549
                                     New polynucleotides encoding ovarian tumor proteins, useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human ovarian tumour associated polynucleotide sequence SEQ ID NO:1320.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAH82377 to AAH83878 represent human ovarian tumour-associated polymucleotide sequences which encode ovarian tumour proteins. The ovarian tumour proteins and polymucleotide sequences have cytostatic activity, and can be used in gene therapy and vaccine production. The ovarian tumour proteins and polymucleotides can be used to inhibit the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel ovarian tumor proteins, and nucleic acids encoding them, used to treat and diagnose cancers, particularly ovarian cancer.

                                                                                                                                                                                                       The present invention relates to novel human NOV proteins and their coding sequences (ACC72075-ACC72181 and ABR58363-ABR58469). The NOV proteins are useful in manufacturing a medicament for treating a syndrome associated with a human disease. The NOV proteins and coding sequences may be used to diagnose, treat or prevent metabolic disorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders and various dyslipidaemias
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NTRAN, neurotransmission-associated protein, cytostatic; antiarteriosclerotic; anti-HIV; antiallergic; cerebroprotective; antiantiantismonian; anticonvulsant; dermatological; nootropic; neuroprotective; antialfammatory; antithyroid; antiarthritic; anorectic; cardiant; hypotensive; hepatotropic; gene therapy; human; gene; ss.

(NTRAM) and encoding polymuclectides. The NTRAM polypeptides can be expressed by standard recombinant methodology. The polypeptides and polymuclectides are the polypeptides and conditions associated with the decreased expression or overexpression of NTRAM, such as autoimmune/inflammatory, cardiovascular, neurological, developmental, cell proliferative, transport, psychiatric, metabolic or endocrine disorders. These diseases may include AIDS, allergies, atopic dermatitis, arthritis, thyroiditis, obesity, Parkinson's disease, troke, epilepsy, myocardial infarction, hypertension, cancer, atherosclerosis or hepatitis. These are also useful in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of NTRAM. The NTRAM or its nucleic acid and amino acid sequences of NTRAM. The NTRAM or its cragments are useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the carrier polymucleotide and compounds that specifically bind toor modulate the arget polymucleotide and compounds that specifically bind toor modulate the polymore and the cormodulate or antagonism of the cormodulate or antagonism or 
                                                                        diagnosing, preventing or treating diseases or conditions associated with aberrant protein expression, e.g. cancer, hepatitis, AIDS, obesity or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the activity of the polypeptide. The microarray is useful in monitoring or measuring protein-protein interactions, drug-target interactions, and gene expression profiles. The present sequence represents a specific

The invention relates to a composition comprising a plurality of cDNAs for detecting the altered expression of genes in an immunological response. The invention also relates to a method of diagnosing or monitoring the treatment of an immunopathological condition in a sample, contacting the treatment of an immunopathological condition in a sample, contacting the nucleic acids of the sample with an array comprising the plurality of cDNAs under conditions to form one or more hybridisation complexes and comparing the levels of the detected in a non-diseased sample, where an altered level of the detected hybridisation complexes with the level of hybridisation complexes corelates with the presence of an immunopathological condition. Also disclosed are an expression profile comprising a microarray and a plurality of detectable complexes and a microarray and a plurality of detectable complexes and comparing a plurality of detectable complexes and comprising a plurality of detectable complexes and comprising a plurality of detectable complexes and comprising a plurality of decince the disquession of target polymucleotides. The microarray for monitoring the expression of target polymucleotides. The microarray can be used in the expression of target polymucleotides. The microarray can be used in drug discovery and development, toxicological and carcinogenicity studies, forensics or pharmacogenomics. The composition carcinogenicity studies, forensics or pharmacogenomics. The composition carcinogenicity studies, forensics or pharmacogenomics. The composition complexed in drug discovery and development, toxicological and carcinogenicity studies, forensics or pharmacogenomics. The composition complexed in the printed specification of a subpopulation of a form part of conversed to the printed specification but was obtained and the elected format directly such a position of the printed per person of the printed per person of the printed pers
A composition comprising a plurality of cDNAs, useful for detecting altered expression of genes in an immunological response or for diagnosing and treating an immunopathology, e.g. Crohn's disease, asthma or osteoarthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       635

(INCY-) INCYTE CORP.

```
The invention relates to polynucleotides which are used as probes to detect genes differentially expressed in an immunological response, abundantly expressed in an immunological response, abundantly expressed in an immunological response and/or coding for a polypeptide known to regulate blood cell biology. The polynucleotides are useful in research and diagnostic applications particularly in cancer and immunopathological conditions, such as AIDS, allergies, ansemia, asthma, atherosclerosis, bronchitis, ulcerative colitis, diabetes, multiple sclerosis, osteoporosis, pancreatitis, infections and arthritis. The present sequence represents a human lymph node cDNA used to detect blood cell and immunological response gene expression. Note: The present sequence does not appear in the printed specification but was obtained in electronic format from the USPTO web site (seqdata.uspto.gov/sequence.html?DocID=2004003).
                                                                          New compositions having a number of first, second and third polynucleotide probes, useful in research and diagnostic applications in cancer and immunological conditions e.g. AIDS, diabetes, osteoporosis and infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 1201 BP; 293 A; 342 C; 347 G; 219 T; 0 U; 0 Other;
                                                                                                                                                                                                                           Claim 15; SEQ ID NO 140; 16pp; English.
